UzCombinator · Batch 3

GPU Passport

Proof of where an AI chip is, and what ran on it.

Komiljon Kosimov · Tashkent · UzCombinator Batch 3

Why this, why Uzbekistan

Make Uzbek compute provable.

UzCombinator's Batch 3 call asks two questions (themes 2 and 3): how can Uzbekistan make it easy for data-center and inference companies to choose it, and how do we protect AI infrastructure?

2026

Uzbekistan's first Hopper-class GPUs arrived under US export licences.

Nov 2025

Ministry Nvidia purchases awaited US export-control approval (Kun.uz).

~$6B

Data-center commitments announced, Sep 2026.

[assumption: press figure]

The problem

A label is not evidence.

Banks, ministries and foreign AI firms buying "sovereign" compute get a promise.

Providers place jobs on whatever GPU is free, anywhere in the world. They cannot honestly sell an "Uzbekistan-only" pool without per-job proof.

How it works

The speed of light is the witness.

1 · Challenge

A checker inside Uzbekistan sends a fresh random number.

Never reused, so it can't be replayed.

2 · Sign

An agent on the GPU server signs it with the GPU's identity.

Hardware-bound via NVIDIA confidential-computing attestation where the chip supports it.

3 · Bound

Light in fiber caps the distance. 1 ms round trip ≈ at most 100 km.

Result: a signed certificate per GPU and per job.

Honest about borders

Delay alone cannot prove a border.

Shymkent, Kazakhstan is about 120 km from Tashkent. So we use two layers.

Layer 1 · In the room

A small anchor box inside the data center proves the GPU is on the same local network. Sub-millisecond.

Layer 2 · In the country

Anchors in Tashkent, Samarkand, Fergana, plus one abroad, and site registration place that anchor.

Every certificate states exactly what it proves.

Working prototype

It already works.

Test, measured from Tashkent	Round trip	Distance bound
Server in Belgium	98.9 ms	**≤ 9,886 km**
Same server behind a relay in Tashkent (relay exposed)	100.3 ms	**≤ 10,032 km**
NVIDIA T4, US East (Modal)	176.8 ms	**≤ 17,681 km**
NVIDIA T4, US West (Modal)	248.8 ms	**≤ 24,882 km**
NVIDIA RTX 5070, Tashkent, same network	3.19 ms	**≤ 319 km**

Bounds are loose upper limits; Belgium is really about 4,800 km away. Next: hardware-bound keys. A copied software key is the known gap.

The gap

Others prove what runs. Nobody proves where.

NVIDIA Fleet Intelligence

Free since May 2026. Attestation only on Blackwell and Rubin, verified through NVIDIA's own service.

Tinfoil · Phala · io.net

Prove which code runs on a secured GPU, not where it sits. Potential partners for attestation.

GPU Passport

The in-country notary. Works on the Hopper and Ampere GPUs Uzbekistan runs. Evidence stays in the country.

Customers and model

Operators pay first.

1 · GPU operators

pro-data.tech, Uztelecom GPU services in Bukhara and Kokand, AI clouds such as Core AI. They need licence and compliance evidence.

2 · Sovereign tenants

Banks and ministries.

3 · GPU marketplaces

Selling country-pinned pools.

Model: per-GPU monthly subscription, $10–20 per GPU-month [assumption], plus evidence exports.
Expansion: every Central Asian, Caucasus and Gulf country building AI data centers.

The next 45 days

From prototype to a first partner.

Weeks 1–2	Anchors in Tashkent, a 2nd city and Almaty. Attestation with NVIDIA open-source tools.
Weeks 3–4	Install at one operator.
Weeks 5–6	Dashboard and evidence export.
Demo Day	GPUs under passport, and one signed LOI.

Komiljon Kosimov, 21

Backend and AI-infrastructure engineer. Led a backend team of 10+ engineers. Main developer of an AI inference gateway. Built a production face-recognition attendance service with anti-spoofing. Founded the Central Asian University cybersecurity club.

The ask

- Business co-founder
- 3 design partners
- Intros to GPU operators
